

USB 2.0 Controller Mac OS10.1x Installation:

Introduction:

USB 2.0 controller is a 2-in-1 controller. It has two USB 1.1 controllers and one USB 2.0 controller integrated into a single board. However, in OS 8.6, OS 9.x, and OS 10.0, the USB 2.0 controller is not supported since the USB 2.0 driver is not compatible in these operating systems. The USB 2.0 controllers will only work as an USB 1.0/1.1 controller in the above OS.

In order to support the USB 2.0 function, Mac OS 10.1 or later is required. Please follow the instruction below for proper driver installation.

Mac OS 10.1x Driver Installation:

1. Double click the driver file.
2. Double click the decompressed file icon (USB2EHCI_v1.07.xxx) to start the Installer wizard
3. Follow the Installer wizard instruction to complete the installation;
you will need administrator password to continue the installation
4. Restart the computer to accept new setting

To Verify for Successful Installation:

1. Open the OS 10.1x partition/volume
2. Go to System/Library/Extensions folder
3. If the file "OMI_EHCI.kext" is in the Extension folder, the USB 2.0 driver is installed successfully
